

CONTINUOUS MONITORING

Continuous Monitoring & Log Management

Defines what is monitored (by subprocessors), what is logged, log schema, and alert review cadence.

Monitoring is delegated to subprocessors (WorkOS audit log, Vercel Observability, Supabase audit log). Masar Zero does not operate its own SIEM, HIDS, or 24x7 SOC. This procedure defines the log sources, the required log fields, the alert review cadence (founders review as alerts arrive), and escalation.

Revision History

Version	Date	Author	Summary of Change
v1.0	12 July 2026	Masar Zero	Initial release of Continuous Monitoring & Log Management Procedure.

Approval

This document is prepared by Hari Krishna and approved by Dr. A. Latif Alkhaja, Chairman of Masar Zero W.L.L. It is effective as of the date shown above and is reviewed annually or upon significant change per MZ-POL-001 §7. Distribution is restricted to authorized recipients; redistribution requires written approval from Masar Zero leadership.

1. Purpose & Scope

This procedure defines the continuous monitoring controls Masar Zero W.L.L. applies to detect, alert on, and respond to security-relevant events. It is operated by Masar Zero founders; there is no dedicated SOC or 24x7 on-call rotation.

Monitoring is delegated to subprocessors. Masar Zero does not operate its own SIEM, HIDS/HIPS, or IDS/IPS. The procedure covers the following log sources: (a) WorkOS authentication and audit logs; (b) Vercel application and access logs; (c) Supabase database and audit logs; (d) WeCon cloud API access logs. The plant-floor WeCon box is on an air-gapped network with no inbound path; its monitoring is limited to local HMI alarm display.

2. Log Sources & Schema

Every log source produces events that comply with the schema defined in this section. The schema ensures that the six required event attributes from questionnaire items 4.3.1 through 4.3.6 are captured for every event.

Required Field	Definition	Example
Outcome	Success or failure of the event.	success / failure
Event type	Categorization of the event.	auth.login, config.change, data.read
Timestamp	Date and time (UTC, ISO 8601).	2026-07-12T08:14:32Z
Source	Originating system / IP.	workos.com, vercel.app, supabase.co
Subject identity	User or service account associated.	operator@masarzero.com, svc.vercel-deploy
Location	Asset / module where the event occurred.	dashboard.masarzero.com, supabase-proj-123

Table 1 — Mandatory log event schema (per questionnaire 4.3.1-4.3.6).

3. Log Collection & Storage

Logs are collected and retained by each subprocessor per their platform defaults:

- **WorkOS audit log** — retained 13 months by WorkOS. Founders can export via WorkOS admin API.
- **Vercel Observability** — retained 1 month by Vercel. Founders can view in Vercel dashboard.
- **Supabase audit log** — retained per Supabase plan. Founders can query via SQL.
- **WeCon cloud API access logs** — retained per WeCon platform policy.

Masar Zero does not centralize logs into its own SIEM. Founders review logs in each subprocessor's native dashboard. This is a deliberate scope decision: Masar Zero is a small startup and operates a small number of cloud resources; the subprocessor-native dashboards are sufficient for the current scale.

4. Privileged Function Logging

All actions performed by users with elevated privileges are logged by the respective subprocessor. This includes: (a) all WorkOS Administrator-role actions; (b) all Supabase service-role SQL operations; (c) all Vercel deployment actions; (d) all WeCon cloud console configuration changes. Founders review these logs on an ad-hoc basis as alerts arrive; there is no formal weekly review cadence.

5. IDS / IPS Implementation

Masar Zero does not operate its own IDS/IPS. Intrusion detection and prevention is provided by subprocessors:

Layer	Mechanism (Subprocessor)	Coverage
Cloud edge	Vercel Always-On DDoS Protection + WAF	L3/L4/L7 attacks against the dashboard.
Application	Vercel WAF rules + application rate-limiting	OWASP Top 10, brute force, scraping.
Database	Supabase row-level security + audit logging	Unauthorized row access.
Plant floor	Air-gap (no inbound path)	See BAPCO-QR-001 §2.

Table 2 — IDS/IPS implementation by layer (all subprocessor-operated).

6. Alerting & Review Cadence

Subprocessors send alerts to founders via email (and Slack where configured) per their platform defaults. Founders review alerts as they arrive during business hours. There is no 24x7 on-call rotation. The alert categories and review cadence are:

Category	Trigger	Channel	Cadence
High	Failed login burst; privileged action from new IP; subprocessor security incident notification.	Email to founders	Business hours, ASAP
Medium	Repeated auth failures; WAF rule hit; RLS policy denial.	Email to founders	Daily review
Low	Routine log volume anomalies; non-blocking WAF hits.	Subprocessor dashboard	Weekly review

Table 3 — Alert categories, triggers, and review cadence.

Honest scope limitation. Masar Zero does not operate a 24x7 SOC or formal on-call rotation. Alerts that arrive outside business hours are reviewed at the start of the next business day. For incidents affecting customer station operations, founders are reachable via the customer notification contacts in MZ-POL-007 §5.

7. Escalation & Incident Response

Alerts that cannot be dismissed as false positives are escalated to the Incident Response process per MZ-POL-007. Founders handle all incidents directly; there is no dedicated IR team. For incidents affecting customer station operations, founders notify the customer per MZ-POL-007 §5 within 72 hours.
