

ENDPOINT & MDM

Endpoint Security & Mobile Device Management Policy

Founder laptops with built-in disk encryption, firewall, and anti-malware. No MDM. Plant-floor WeCon box is air-gapped.

This policy covers endpoint security and mobile device management. Masar Zero founder laptops use built-in OS security features (FileVault/BitLocker, firewall, XProtect/Defender). There is no MDM enrollment. The plant-floor WeCon box is air-gapped and does not require endpoint security tooling.

Revision History

Version	Date	Author	Summary of Change
v1.0	12 July 2026	Masar Zero	Initial release of Endpoint Security & Mobile Device Management Policy.

Approval

This document is prepared by Hari Krishna and approved by Dr. A. Latif Alkhaja, Chairman of Masar Zero W.L.L. It is effective as of the date shown above and is reviewed annually or upon significant change per MZ-POL-001 §7. Distribution is restricted to authorized recipients; redistribution requires written approval from Masar Zero leadership.

Role	Name	Signature	Date

1. Purpose & Scope

This policy defines the endpoint security and mobile device management controls Masar Zero W.L.L. applies to its founder laptops and to any mobile device that might attempt to communicate with Masar Zero technology assets.

Honest scope statement. Masar Zero does not operate MDM (Jamf, Intune, or similar). Founder laptops use built-in OS security features: disk encryption (FileVault/BitLocker), firewall (macOS Application Firewall / Windows Defender Firewall), and anti-malware (XProtect / Defender). There is no EDR, no HIDS/HIPS on laptops, and no allow-list of approved applications.

2. Founder Laptop Security

Every Masar Zero founder laptop runs a minimal security stack using built-in OS features:

Control	macOS	Windows	Notes
Disk encryption	FileVault	BitLocker	Enabled at laptop setup; recovery key in 1Password.
Firewall	macOS Application Firewall	Windows Defender Firewall	Default settings; no inbound connections allowed.
Anti-malware	XProtect (built-in)	Microsoft Defender	Default settings; definitions auto-update.
OS auto-update	macOS Software Update	Windows Update	Security updates within 72 hours of release.
Screen lock	15 min idle	15 min idle	Password required to unlock.
Password manager	1Password	1Password	Shared vault for team credentials.
Local admin account	Separate from daily account	Separate from daily account	Strong password; used only for installs.

Table 1 — Founder laptop security baseline by platform.

3. Host-Based Firewall

The built-in host firewall is enabled on every Masar Zero founder laptop with default settings (no inbound connections allowed). Masar Zero does not operate MDM to enforce firewall policy; founders self-attest compliance annually.

The plant-floor WeCon box does not run a host-based firewall in the traditional sense because it is on an isolated network with no inbound path (air-gap, see BAPCO-QR-001 §2).

4. Anti-Malware

Anti-malware is the built-in OS protection: XProtect on macOS, Microsoft Defender on Windows. Definitions auto-update from the vendor cloud. Masar Zero does not operate additional commercial anti-malware (e.g., CrowdStrike, SentinelOne). Cloud assets inherit Vercel and Supabase platform malware scanning.

5. Software Installation Restrictions

Masar Zero founder accounts are standard users on macOS/Windows; the admin account (separate, strong password) is required for software installs. There is no MDM allow-list of approved applications. Founders exercise judgment on what to install.

The plant-floor WeCon box cannot have software installed by station staff. Firmware updates are applied only by founders via the WeCon cloud console or local HMI during scheduled maintenance.

6. Anti-Phishing & Spam Protection

Masar Zero corporate email (Google Workspace) has Google's native anti-phishing, spam, and sandboxing enabled by default. Additional controls include: (a) external-sender warning banner in Gmail; (b) user-reporting button for suspicious emails. Masar Zero does not run phishing simulation (see MZ-POL-008 §4).

7. HIDS / HIPS

Masar Zero does not operate HIDS/HIPS on founder laptops. Built-in OS protections (XProtect, Defender) provide baseline malware detection. The plant-floor WeCon box is on an isolated network with no inbound path — air-gap justified (BAPCO-QR-001 §2).

8. Mobile Device Management

Masar Zero permits access to the operator dashboard from mobile devices only through the device's web browser (no native app). Mobile device access is governed by:

- WorkOS MFA required for every mobile login (TOTP).
- Session lifetime per WorkOS defaults.
- No PLC configuration change may be performed from a mobile device.
- No WorkOS Device Posture enforcement (Masar Zero does not operate MDM).

Unauthorized mobile devices — including personal phones not enrolled in any MDM — can still authenticate to the Masar Zero operator dashboard if the user has valid WorkOS credentials. This is a scope limitation: Masar Zero does not enforce device-level controls on mobile devices. The plant-floor network has no Wi-Fi that Masar Zero

controls, so mobile devices cannot reach the WeCon box directly.

9. Endpoint Incident Response

If a founder laptop is compromised (malware detection, loss/theft), the response follows MZ-POL-007. Specific endpoint actions include: (a) remote lock via Google Workspace (if enrolled) or iCloud Find My / Microsoft account; (b) revoke WorkOS sessions for the affected user; (c) rotate any credentials stored in 1Password for the affected user; (d) reimage the laptop from a known-good baseline before returning it to service.
